

in a frame wall (10) via a rotary bearing for being placed against and removed from said frame wall (10), ~~wherein characterized in that~~ a centered rotary bearing (6) is received in a bearing housing (1), the bearing housing (1) is arranged through a rolling bearing mounted linear bearing unit (7) on a connection structure (2) for longitudinal displacement relative to the connecting structure (2), that is connected to the frame wall (10), the journals (4) extend through the connecting structure (2) and the connecting structure (2) comprises a slot (2.2) for limiting the linear displacement. ~~is connected to the frame wall (10).~~

Claim 2 (Currently Amended) A bearing ~~Bearing~~ arrangement according to claim 1, ~~wherein characterized in that~~ the linear bearing unit (7) is composed of a projection (2.1) of the connecting structure (2), which projection (2.1) is V-shaped as seen in cross-section and comprises two first running surfaces (2.1.1), the linear bearing unit (7) being further composed of a correspondingly configured V-shaped recess (1.1) of the bearing housing (1), which recess (1.1) comprises second running surfaces (1.1.1) that are parallel to said first running surfaces (2.1.1), rolling elements (7.1) arranged in an angled flat cage (7.2) roll between said first and second running surfaces, the projection (2.1) and the recess (1.1) being arranged in opposing relationship on upper and lower ends of the connecting structure (2) and the bearing housing (1).

Claim 3. (Currently Amended) A bearing ~~Bearing~~ arrangement according to claim 1, ~~wherein characterized in that~~ the linear bearing unit (7) is composed of a projection of the connecting structure (2), which projection has a rectangular shape as

seen in cross-section and comprises three first running surfaces, the linear bearing unit (7) being further composed of a correspondingly configured recess of the bearing housing (1), which recess comprises second running surfaces that are parallel to said first running surfaces, rolling elements arranged in a flat cage roll between said first and second running surfaces, the projection and the recess being arranged in opposing relationship on upper and lower ends of the connecting structure (2) and of the bearing housing (1).

Claim 4 (Cancelled)

Claim 5 (Currently Amended) A bearing ~~Bearing~~ structure according to claim 1, ~~characterized in that~~ wherein the rotary bearing (6) is configured as a floating bearing or as a fixed bearing.

Claim 6 (Currently Amended) A bearing ~~Bearing~~ arrangement according to claim 1, wherein ~~characterized in that~~ the rotary bearing (6) is configured as a ball bearing, a cylindrical roller bearing, a self-aligning bearing or a taper roller bearing.

Claim 7 (Currently Amended) A bearing ~~Bearing~~ arrangement according to claim 1, wherein ~~characterized in that~~ the bearing housing (1) is equipped with a device (8) for displacing the bearing housing (1).

Claim 8 (Cancelled)
